

TASK 3: SQL FOR DATA ANALYSIS

ECOMMERCE SALES ANALYSIS- Walmart sales

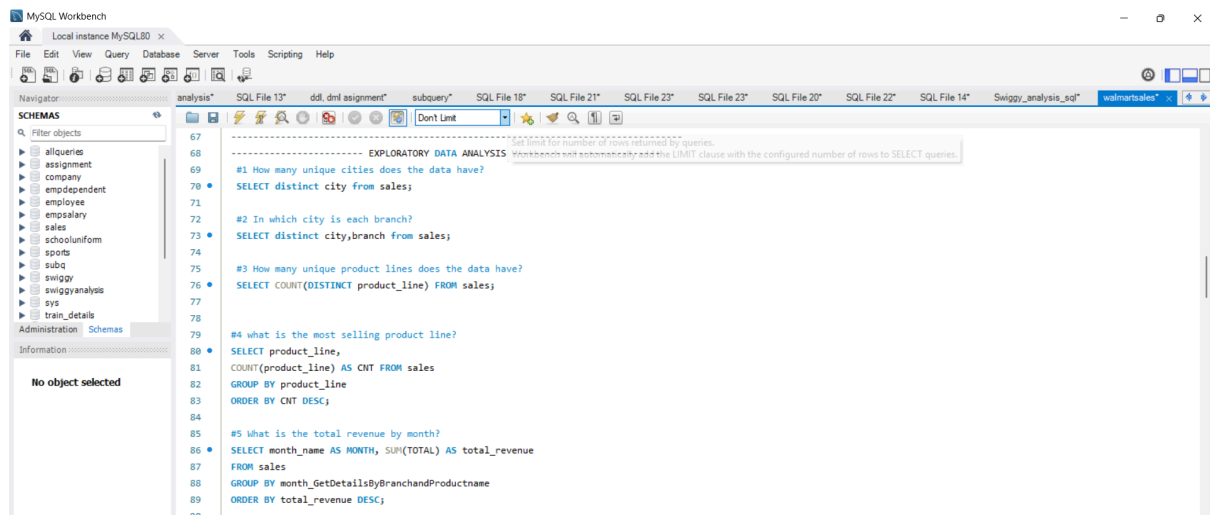

- Create database walmartsales
- Create table sales

The screenshot shows the MySQL Workbench interface. The left sidebar displays the 'SCHEMAS' list with 'walmartsales' selected. The main editor window shows the following SQL script:

```
1 CREATE DATABASE walmartsales;
2 USE walmartsales;
3 CREATE TABLE sales(
4 Invoice_ID VARCHAR(30) NOT NULL PRIMARY KEY,
5 Branch VARCHAR(10) ,
6 City VARCHAR(30),
7 Customer_type VARCHAR(30),
8 Gender VARCHAR(30),
9 Product_line VARCHAR(100),
10 Unit_price DECIMAL(10,2),
11 Quantity INT,
12 VAT FLOAT,
13 Total DECIMAL(12,4),
14 Date DATETIME,
15 Time TIME,
16 Payment_cogs VARCHAR(15),
17 COGS DECIMAL(10,2),
18 gross_margin_pct FLOAT,
19 gross_income DECIMAL(12,4),
20 Rating FLOAT
21 );
```

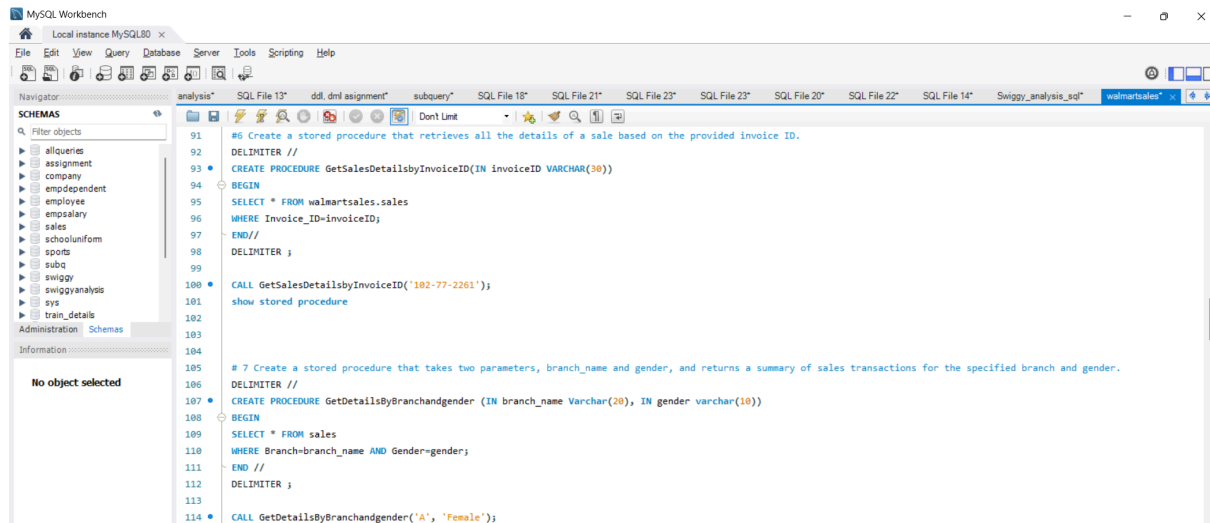

EDA -exploratory data analysis using count, distinct, group by, order by

The screenshot shows the MySQL Workbench interface with the 'walmartsales' database selected. The main editor window displays the following SQL script for exploratory data analysis:

```
67
68
69 ----- EXPLORATORY DATA ANALYSIS -----
70 #1 How many unique cities does the data have?
71 SELECT distinct city from sales;
72
73 #2 In which city is each branch?
74 SELECT distinct city,branch from sales;
75
76 #3 How many unique product lines does the data have?
77 SELECT COUNT(DISTINCT product_line) FROM sales;
78
79 #4 what is the most selling product line?
80 SELECT product_line,
81 COUNT(product_line) AS CNT FROM sales
82 GROUP BY product_line
83 ORDER BY CNT DESC;
84
85 #5 What is the total revenue by month?
86 SELECT month_name AS MONTH, SUM(TOTAL) AS total_revenue
87 FROM sales
88 GROUP BY month_GetDetailsByBranchandProductname
89 ORDER BY total_revenue DESC;
90
```

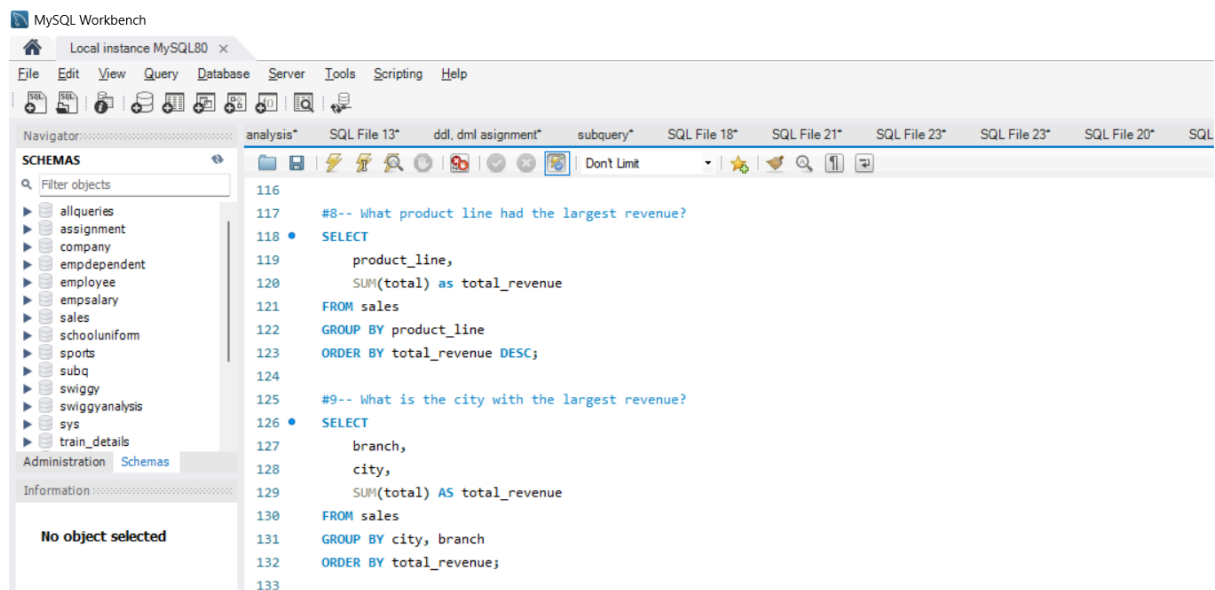

Using Stored Procedure

The screenshot shows the MySQL Workbench interface with a local instance of MySQL 8.0. The left sidebar displays a list of schemas, including 'walmartsales'. The main editor window shows two SQL queries. The first query, labeled '100', creates a stored procedure named 'GetSalesDetailsbyInvoiceID' that takes an 'invoiceID' as input and returns all sales details for that invoice. The second query, labeled '107', creates a stored procedure named 'GetDetailsByBranchandgender' that takes 'branch_name' and 'gender' as inputs and returns a summary of sales transactions for that branch and gender. Both queries are followed by a 'CALL' statement to execute the procedures.

```
91 #6 Create a stored procedure that retrieves all the details of a sale based on the provided invoice ID.
92 DELIMITER //
93 CREATE PROCEDURE GetSalesDetailsbyInvoiceID(IN invoiceID VARCHAR(30))
94 BEGIN
95     SELECT * FROM walmartsales.sales
96     WHERE Invoice_ID=invoiceID;
97 END//
98 DELIMITER ;
99
100 CALL GetSalesDetailsbyInvoiceID('102-77-2261');
101 show stored procedure
102
103
104
105 # 7 Create a stored procedure that takes two parameters, branch_name and gender, and returns a summary of sales transactions for the specified branch and gender.
106 DELIMITER //
107 CREATE PROCEDURE GetDetailsByBranchandgender (IN branch_name Varchar(20), IN gender varchar(10))
108 BEGIN
109     SELECT * FROM sales
110     WHERE Branch=branch_name AND Gender=gender;
111 END //
112 DELIMITER ;
113
114 CALL GetDetailsByBranchandgender('A', 'Female');
```

Using sum

The screenshot shows the MySQL Workbench interface with a local instance of MySQL 8.0. The left sidebar displays a list of schemas, including 'walmartsales'. The main editor window shows two SQL queries. The first query, labeled '118', uses the SUM function to calculate the total revenue for each product line, ordered by total revenue in descending order. The second query, labeled '126', uses the SUM function to calculate the total revenue for each city and branch, ordered by total revenue.

```
116
117 #8-- What product line had the largest revenue?
118 SELECT
119     product_line,
120     SUM(total) as total_revenue
121 FROM sales
122 GROUP BY product_line
123 ORDER BY total_revenue DESC;
124
125 #9-- What is the city with the largest revenue?
126 SELECT
127     branch,
128     city,
129     SUM(total) AS total_revenue
130 FROM sales
131 GROUP BY city, branch
132 ORDER BY total_revenue;
133
```
